Product Backlog

Project Name: LegalSinc

Team Name: CodeLex

URL Document: HW05_Requirement.docx

ID	Feature / User Story	Priority	Acceptance Criteria
PB-001	User authentication and role management. Create accounts and manage permissions for partners, Junior lawyers and assistans.	High	The system enforces role based access control where partners have full control and can restrict functions for other users.
PB-002	Case registration and updates. Register and update legal dockets using mandatory fields.	High	The System allows users to create and modify cases, ensuring key fields are filled.
PB-003	Document Reference Registration. Link local dile paths to specific cases.	High	The system saves the dile path (e.g., “C:\case1.pdf”) as a text attribute within the case record, without processing or parsing the actual file content.
PB-004	Local Alert System. Display upcoming court deadline reminders upon system startup.	High	The application calculates remaining days by comparing target dats and displays a visual alert notification in the console or user interface whenever an upcoming deadline is approaching.
PB-005	Global Client Search. Search for case files using text criteria.	High	The system iterates through stored data (arrays or list) and retrieves records primarily using the Client Name.
PB-006	Audit Log. Track modifications by writing them to a text file.	Medium	The system records the date time, and the user who made a modification by appending a text line to a local log.txt file.
PB-007	Basic Security (Login). Validate access via username and password, masking characters.	Medium	The system allows logging in by verifying credentials against a local text file, masking the password with asterisks on the screen.
PB-008	Data Import via CSV. Import case progress from a structured text file.	Medium	The system reads a .csv file (comma-separated values), parses the data, ans automatically creates case objects in memory.

PB-009	Automatic Document Generation. Auto-fill basic legal document templates with client data.	Low	The system extracts data from the case object (e.g. client name, defendant) and automatically generates a .txt file with a preestablished format ready for printing.
