Polymorphism, Interfaces and Abstraction

Polymorphism (Many Forms)

- One common reference type
- For overridden instance methods, the actual object determines which implementation runs at runtime

Interface (A Contract)

- A Java type that specifies operations and objects must support
- A class uses implements; an interface extend another interface
- A class can implement multiple interfaces

Abstraction (Focus on Essentials)

- Model relevant features and hide unnecessary implementation details
- Abstraction is a design principle

* Interface VS Abstract Class

Feature	Interface	Abstract Class
Main	Contract	Shared base for subclasses
Instance Fields	No	Allowed
Constructors	No	Allowed
Create Directly	No	No
