Product Backlog

Project Name: LegalSync

Team Name: CodeLex

URL Document:HW05_Requirement V2.0.docx

Document Version History

Version	Date	Authors	Description of Changes
1.0	October 10, 2026	Team CodeLex	Initial Product Backlog with 9 user stories
2.0	October 17, 2026	Team CodeLex	Update on client needs and technical requirements for the course project: console-based menu with keyboard input, data persistence using JSON files, a hierarchy of 6 roles identified by email, classification of cases as Active/Passive based on legal category, logging of expenses/debts per case, and generation of CSV reports.

ID	Feature / User Story	Priority	Acceptance Criteria
PB-001	Hierarchical Role and Access Management via Email: Create accounts and manage permissions for the firm's 6 user roles using email.	High	The system implements role-based access control, in which the Principal Director (DIRECTOR) has full authority to grant access, review users, and assign or modify roles linked to email addresses (DIRECTOR, PARTNER, ASSOCIATE_LAWYER, JUNIOR_LAWYER, LEGAL_ASSISTANT, and SECRETARY), with all data stored in `users.json`. The SECRETARY role is restricted to read-only access for viewing case statuses, the calendar, and records of payments/expenses.
PB-002	Basic Security and Credential Validation	High	The system allows users to log in by entering credentials via the

	(Login). Validate system access via the console using a registered email/username and password.		keyboard, verifying them against records stored in `users.json`, confirming that the account has been enabled by the Principal Director, and loading the console menu options
PB-003	Registry of Clients and Defendants. Register and update information regarding clients and counterparties involved in legal proceedings.	High	The system allows for the entry and update via keyboard of mandatory data for clients and defendants (unique ID, identification number, full name, phone number, email, and address), storing these objects persistently in `clients.json`.
PB-004	Registration, Coding, and Legal Classification of Cases. Creating and updating judicial case files using mandatory classification fields.	High	The system allows authorized users to create and modify case files, validating mandatory fields: unique case ID, official trial code, legal category (Criminal, Family/Support, Civil, Labor), type of proceeding, priority (HIGH, MEDIUM, LOW), judicial unit, assigned attorney, client, defendant, and status (ACTIVE or PASSIVE), with the data being persisted in `cases.json`.
PB-005	Multi-criteria search for cases and clients. Quickly search and filter files using multiple criteria.	High	The system iterates through the collections loaded from `cases.json` and retrieves case files by Case ID, Client Name, Legal Category, or Case Status (ACTIVE / PASSIVE). When a case is opened in the console, it displays the associated client's profile along with their complete debt/payment status.
PB-006	Case Expense Ledger and Client Debts. Record detailed litigation expenses and track outstanding debts on a per-case basis.	Medium	The system allows authorized users to record individual expense items for a case in `cases.json` (including the amount, date, a detailed description of the legal cost, and payment status). The system automatically calculates the client's total accumulated debt for that case and displays on-screen whether the balance is PENDING or PAID IN FULL.
PB-007	Attorney Arrangements, Tasks, and Calendar Schedule. Record procedural arrangements, modify pending items, and check court dates.	Medium	Attorneys can add tasks and provisions to a case, assign them to junior lawyers or legal assistants (by judicial unit), and update the status of pending items in `cases.json`. Hearing dates and deadlines are

			stored, the number of days remaining is calculated, and they are displayed in the console as a chronologically ordered schedule for reference by staff and the clerk’s office.
PB-008	Document Reference Registry and Audit Log. Link file paths to cases and track system modifications.	Medium	The system stores the local file path (e.g., "C:\case1.pdf") and metadata for the document or piece of evidence as text attributes within the case in `cases.json`. Furthermore, every modification made to cases, pending items, or expenses is automatically recorded including the date, time, action, case ID, and user (email/role) in the `audit_log.json` file.
PB-009	Generation of Data Reports in CSV. Export structured reports on legal cases and account statements/billing in CSV format.	Medium	The system extracts information stored in memory/JSON and generates report files in .csv format:`cases_report.csv`, containing a categorized list of cases, and `billing_report.csv`, providing a breakdown of expenses, invoices, and outstanding balances by client for review by the Director and the Secretary.
